### Description:

Fresh green needles and a compact habit make this slow growing dwarf evergreen a great choice for smaller landscapes and rock gardens; features a wide irregular shape and flat top and is a superior choice for its vigor and hardiness

### Ornamental Features

Dwarf Norway Spruce has dark green foliage which emerges light green in spring. The needles remain dark green throughout the winter. Neither the flowers nor the fruit are ornamentally significant.

### Landscape Attributes

Dwarf Norway Spruce is a dense multi-stemmed evergreen shrub with a more or less rounded form. Its relatively fine texture sets it apart from other landscape plants with less refined foliage.

This is a high maintenance shrub that will require regular care and upkeep. When pruning is necessary, it is recommended to only trim back the new growth of the current season, other than to remove any dieback. Deer don't particularly care for this plant and will usually leave it alone in favor of tastier treats. It has no significant negative characteristics.

Dwarf Norway Spruce is recommended for the following landscape applications;

- Mass Planting
- Hedges/Screening
- General Garden Use

### Planting & Growing

Dwarf Norway Spruce will grow to be about 4 feet tall at maturity, with a spread of 5 feet. It tends to fill out right to the ground and therefore doesn't necessarily require facer plants in front. It grows at a slow rate, and under ideal conditions can be expected to live for 50 years or more.

# Bachman's™

Growing Since 1885

This shrub should only be grown in full sunlight. It does best in average to evenly moist conditions, but will not tolerate standing water. It is not particular as to soil type or pH, and is able to handle environmental salt. It is highly tolerant of urban pollution and will even thrive in inner city environments. This is a selected variety of a species not originally from North America.
